

White Trout-lily

Erythronium albidum

Description

White trout-lily is a perennial herb, producing a stem 4 to 6 inches (10-15 cm) tall. The leaves are basal and paired, usually spotted or mottled, elliptic or lance-shaped and up to 6 inches (15 cm) long. The white (sometimes slightly tinged with blue or pink) flowers are produced singly at the end of long stalks in late April and early May. The flowers nod downward and have white 6 petals/sepals that curve strongly upward.

Distribution & Habitat

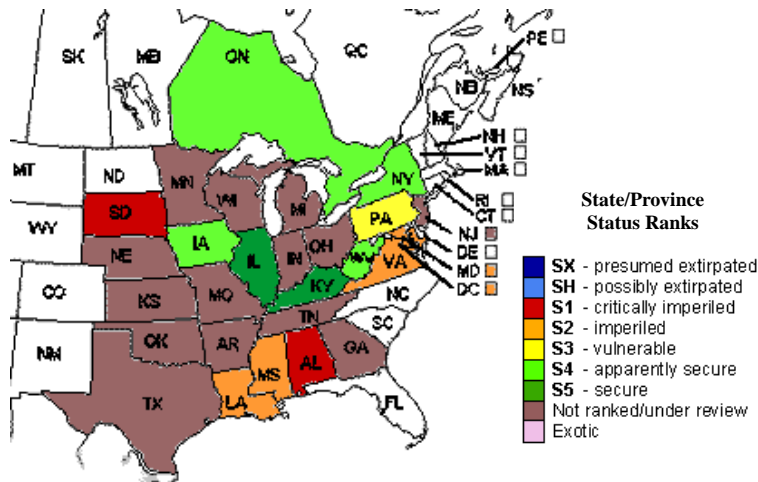

White trout-lily has a distribution from Ontario and New York south into Texas and the Gulf Coast states. In Pennsylvania, the occurrences are rather widespread throughout the state, particularly along the major rivers and streams. The species grows in bottomlands, floodplains, and lower slopes, especially on limestone substrates.

North American State/Province Conservation Status

Map by NatureServe 2014

Current State Status

The PA Biological Survey (PABS) considers white trout-lily to be a species of special concern, based on the relatively few occurrences that have been recently confirmed. It has a PA legal status of Rare.

Conservation Considerations

More field surveys are needed to determine the range, abundance, and ecological requirements of the white trout-lily before a more definitive conservation status, if needed, can be assigned.

NatureServe conservation status ranks

G5 – Globally secure; S3 – Vulnerable in Pennsylvania

Pennsylvania Distribution

White Trout-lily (*Erythronium albidum*)
