

Twig-rush

Cladium mariscoides

Description

Twig-rush is a perennial grass-like herb with upright stems that grow to 40 inches (1 m) tall. The leaves are linear, rough along the edges, and about 1/8 inch (3 mm) wide. The individual flowers, appearing in summer, are minute and are grouped in small, brown spikelets that are covered by spirally arranged scales. The spikelets are grouped into 1/4 inch (6 mm) heads which are displayed in a narrow cluster. The fruits are about 1/8 inch (3 mm) long and acorn-shaped.

Distribution & Habitat

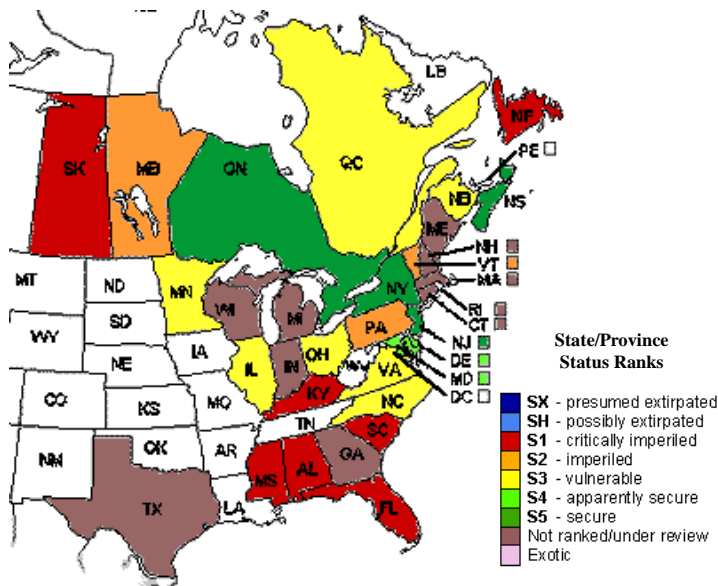

Twig-rush has a range from eastern and central Canada south into Texas and the Gulf states. In Pennsylvania, it has been documented historically in scattered locations, particularly in the glaciated northwestern and northeastern counties. It grows in quaking bogs, marshes, fens, and along shorelines of lakes and ponds.

North American State/Province Conservation Status

Map by NatureServe 2014

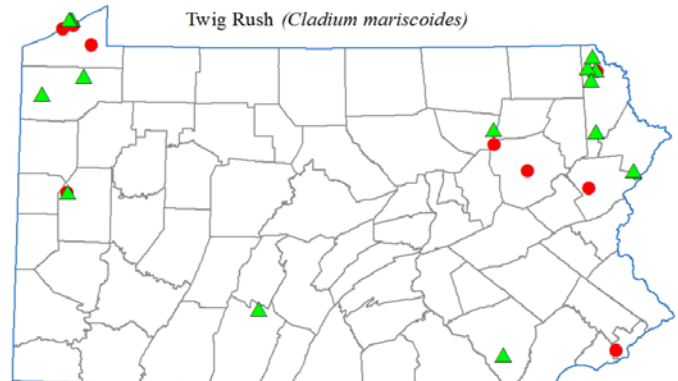

Current State Status

The PA Biological Survey (PABS) considers twig-rush to be a species of special concern, based on the few occurrences that have been recently confirmed and its wetland habitat. It has a PA legal rarity status and a PABS suggested rarity status of Endangered. About 15 populations are currently known in the state.

Twig Rush (*Cladium mariscoides*)

▲ records since 1980 ● records pre-1980

Pennsylvania Natural Heritage Program Data 3-2014

Conservation Considerations

The viability of populations of twig-rush and its habitat may be enhanced by creating buffers around wetlands, controlling invasive species, and protecting the natural hydrology surrounding wetlands.

NatureServe conservation status ranks

G5 – Globally secure; S2 – Imperiled in Pennsylvania
